

EcoShield

Bulk Tea Packaging Solution

Approximately 45% of Sri Lankan tea is exported in Bulk. This 106.8 million Kgs was traditionally packed in a Tea Chest, but later for economic reasons moves to many options. As the world moves towards sustainable packaging and related laws take shape, bulk tea packaging which demands much packaging would move towards more sustainable options.

ECO Shield is a new breakthrough development that focusses on three key aspects meeting the key demands of the industry.

- Keeping fine Sri Lankan quality tea fresh until it reaches its transit or final destination.
- Packaging can be termed "sustainable" in line with global Circular packaging requirements. (Regarding regulation)
- Overall end to end cost would be lower than any other conventional packing material.

POLYDIME

PLASTICS

POLYDIME has been associated with the plastics industry since 1998 producing Grow bags, Polythene in roll, bag and pouch form, Irrigation Pipes, Multilayer laminated packaging and Bio plastics products. With 5 factories in Sri Lanka and India together with a workforce of approximately 700 strong staff, our vision is to be the more Diverse, Innovative, Mechanically Advances, Eco Friendly Inventor in the Plastics Industry.

Specification that Guarantee's Freshness

- Product consists of two unique layers of 100% plastic from the same Polymer Family that enables recyclability in a PE recycle stream.
- Printable Barrier layer is a Polyethylene film with a special metalised coating that achieves heavy duty barrier layer ensuring no moisture and oxygen transmission guaranteeing excellent barrier properties. The 2nd Polyethylene layer is for heavy duty sealing that ensures perfect seal.

Certification available confirming the following barrier properties –

WVTR (0.5 – 1.5 g/m²/day) and OTR (0.5 – 3 cc/m²/day)

- Since the packing material is recyclable, it can be collected at final destination, whether post estate or post export in an export marker and recycled. It must be noted that PE waste is the most versatile and sought after in Sri Lanka and many other key bulk tea export areas.

Packaging regulations in Europe are changing — and recyclability is becoming essential. Under the EU Packaging and Packaging Waste Regulation (PPWR), packaging placed on the European market will increasingly need to meet strict recyclability requirements. From 2030*, packaging must meet defined recyclability performance grades, while from 2038 only the higher-performing Grades A or B will be permitted. Choosing recyclable packaging today helps brands prepare for tomorrow — supporting circularity, potential EPR cost advantages and continued access to the European market.

Reference: Regulation (EU) 2025/40 on Packaging and Packaging Waste (PPWR), **Article 6 – Recyclable Packaging & Annex II, Table 3 – Recyclability Performance Grades.**

*Subject to the implementation timelines specified in Article 6 of Regulation (EU) 2025/40.

Marketing Mileage for Sustainability

Every order that is placed with Polydime for ECO Shield products would be featured on our sustainability website, www.upr.lk. Your company would be highlighted as an advocate of using sustainable packaging together with the volume that you have purchased.

Plastic is Treasure

Plastic has value - The Polydime Group is the largest Collector and Recycler of PE based Plastic waste. This is processed into products that add value in our economy and reducing plastic waste. Further if in Sri Lanka, Polydime can collect back empty bags for recycling and pay the seller as price for it. If overseas, the PE recycle operation is widespread. We can link your customer up with a recycler accordingly.

Product Patent

ECO Shield, due to its high investment in production technology is patented product sold under strict trademark. As such an NDA needs to be signed up with any customer that would be willing to work with us.
